

# STEALTH TANK

## ABOUT THE STEALTH TANK

Military strength of a country is defined by the quantity and type of technology they use. Technology in the domain of transportation has seen less development in the EV spectrum of things. Tech and Uniqueness have been dormant in the Indian Market for a few years.

India has agile Military tanks such as Arjun and defense vehicles provided by Leyland and TATA who have achieved great milestones in bringing forth and developing these types of vehicles

Stealth Tank is designed to take on some of the toughest terrains the world can throw at it. It has a low centre of gravity, meaning can climb up almost vertical Dunes, Rocks and mountains. The highly capable electric drive system provides abundance of torque and power for the vehicle to tread away or towards the enemy.

Handling characteristics are much better than the conventional type of Military tank due to low profile.

It has a capacitor Start Run Motor, which is one of the most silent motors out in the market today. This allows for a large combat Spec Vehicle to be used in sting operations and can pass as if unheard.
